MEMORANDUM

Date: May 15, 2019

Subject: Common Triazole Metabolites: Updated Dietary (Food + Water) Exposure and Risk Assessment to Address The New Section 3 Registrations For Uses of Difenoconazole on Vegetable, Root, Subgroup 1A and Vegetable, Leaves of Root and Tuber, Group 2 and Establishment of a Tolerance with No U.S. Registration for Imported Tea and the New Active Ingredient Mefentrifluconazole on Numerous Crops.

PC Codes: 600074 (1,2,4-Triazole), 600011 (Triazolylalanine), 600082 (Triazolylacetic Acid)	DP Barcode: D450540 & D450770
Decision No: 543310, 547313	Registration No.: None
Petition No.: 8F8695, 8E8728	Regulatory Action: Section 3
Assessment Type: Single Chemical, Dietary	Registration Case No.: None
TXR No.: None	CAS No.: 288-88-0, 86362-20-1
MRID No.: None	40 CFR: None

To: Lindsay Roe (RM-22)
Fungicide Branch
Registration Division (7505P)

Background

In November 2016, HED issued a dietary exposure and risk analysis (D435630) for the common triazole metabolites 1,2,4-triazole (T), triazolylalanine (TA), and triazolylacetic acid (TAA). This current assessment is a further update to address requested Section 3 registrations for use of the triazole-derivative fungicides difenoconazole and mefenitrifluconazole.

Executive Summary

Acute and chronic aggregate dietary (food and drinking water) exposure and risk assessments were conducted using the Dietary Exposure Evaluation Model software with the Food Commodity Intake Database (DEEM-FCID) Version 3.16. This software uses 2003-2008 food consumption data from the U.S. Department of Agriculture's (USDA's) National Health and Nutrition Examination Survey, What We Eat in America, (NHANES/WWEIA). The analyses were performed to support Section 3 registrations for use of difenoconazole and mefenitrifluconazole.

Four assessments were conducted: acute and chronic durations for T, and acute and chronic durations for combined residues of TA and TAA. As with the previous triazole metabolite assessments, this assessment includes exposure estimates resulting from direct consumption of T, TA, and TAA as well as indirect exposure resulting from consumption of parent fungicides followed by *in vivo* conversion to the metabolites. The occurrence of triazole pyruvic acid and triazole lactic acid in metabolism studies is low; therefore, those two metabolites have not been explicitly included in this risk assessment. For each food form in the acute assessment, the residue used is the maximum estimate from the various food/triazole fungicide combinations combined with the average indirect residue estimate. For the chronic assessments, the residue estimates are the average residue from the food-specific food/triazole combinations combined with the average indirect residue estimates. All four assessments assume 100% crop treated and include conservative estimates for residues of the metabolites in drinking water. The resulting exposure and risk estimates are based on health-protective assumptions and should be characterized as conservative.

For all four analyses, risk estimates are below HED's level of concern for all population subgroups. There are no dietary exposure considerations for the common triazole metabolites that would preclude granting the registration requests for difenoconazole and mefenitrifluconazole.

I. Introduction

Dietary risk assessment incorporates both exposure and toxicity of a given pesticide. For acute and chronic assessments, the risk is expressed as a percentage of a maximum acceptable dose (i.e., the maximum dose for which HED has concluded there is a reasonable certainty of no harm). This dose is referred to as the population adjusted dose (PAD). The PAD is equivalent to point of departure (POD, NOAEL, LOAEL, e.g.) divided by the required uncertainty or safety factors.

For acute and non-cancer chronic exposures, HED is concerned when estimated dietary risk exceeds 100% of the PAD. HED is generally concerned when estimated cancer risk exceeds one in one million. References which discuss the acute and chronic risk assessments in more detail are available on the EPA web site: "Available Information on Assessing Exposure from Pesticides, A User's Guide," 21-JUN-2000, web link: <http://www.epa.gov/fedrgstr/EPA-PEST/2000/July/Day-12/6061.pdf>; or see SOP 99.6 (20-AUG-1999).

The most recent dietary risk assessment for the common triazole metabolites was conducted by Thurston Morton (D448161, 08/08/2018).

II. Residue Information

These dietary assessments include all of the uses addressed in the previous assessments. The metabolite residues associated with the requested new uses for difenoconazole and mefentrifluconazole have been added in these analyses. Parent tolerances for these new uses are summarized in Table 1.

Table 1. Tolerance Summary

Chemical	Petition Number	Commodity	Parent Tolerance (ppm)
Difenoconazole	8F8695 (1A) and 8E8728 (tea)	Tea, dried	15
		Vegetable, root, subgroup 1A	0.6
		Vegetable, leaves of root and tuber, group 2	8
		Liver of cattle, goat, horse, sheep	0.7
Mefentrifluconazole	7F8612	Beet, sugar, roots	0.60
		Beet, sugar, leaves	9.0
		Cattle, fat	0.20
		Cattle, meat byproducts	0.30
		Cattle, meat	0.03
		Cherry subgroup 12-12A	4.0
		Corn, field, grain	0.01
		Corn, sweet, kernel plus cob with husks removed	0.03
		Corn, pop, grain	0.01
		Egg	0.01
		Fruit, citrus, group 10-10, oil	15
		Fruit, pome, group 11-10	1.5
		Fruit, small, vine climbing, except fuzzy kiwifruit, subgroup 13-07F	1.5
		Goat, fat	0.20
		Goat, meat byproducts	0.30
		Goat, meat	0.03
		Grain, cereal, group 15, except wheat and corn	4.0
		Grape, raisin	4.0
		Grapefruit subgroup 10-10C	0.50
		Hog, fat	0.015
		Hog, meat byproducts	0.03
		Hog, meat	0.01

Chemical	Petition Number	Commodity	Parent Tolerance (ppm)
		Horse, fat	0.20
		Horse, meat byproducts	0.30
		Horse, meat	0.03
		Lemon/lime subgroup 10-10B	1.0
		Lentil, dry, seed	2.0
		Milk	0.03
		Milk, fat	0.80
		Nut, tree, group 14-12	0.06
		Orange subgroup 10-10A	0.60
		Peach subgroup 12-12B	1.5
		Peanut	0.01
		Plum subgroup 12-12C	2.0
		Plum prune, dried	4.0
		Poultry, fat	0.015
		Poultry, meat byproducts	0.01
		Poultry, meat	0.01
		Rapeseed subgroup 20A	1.0
		Sheep, fat	0.20
		Sheep, meat byproducts	0.30
		Sheep, meat	0.03
		Soybean, seed	0.40
		Vegetable, legume, group 6, except lentil	0.15
		Vegetable, tuberous and corm, subgroup 1C	0.04
		Wheat, grain	0.30

The residue estimates derived from the parent tolerance in Table 1 include dietary exposure to the triazole metabolites due to the direct consumption of metabolite residues in foods as well as indirect exposure resulting from ingestion of parent triazole-derivative fungicides and the subsequent *in vivo* conversion of parent compound to T and/or TA/TAA. As with previous assessments, maximum direct exposure estimates and average indirect exposure estimates were combined to assess acute risks, and average direct and indirect exposure estimates were combined to assess chronic risks. An assumption of 100% crop treated was made for both the free triazole and the conjugated triazole assessments. Default processing factors have been used in these analyses. The residue estimates were derived using a Microsoft® Excel spreadsheet that takes into account the parent-compound tolerance, metabolism factors, and any empirical data that are available for the triazole metabolites. Conservative estimates of residues are chosen so that exposure will not be underestimated. The direct and indirect residue values are combined to give the overall residue estimates used in the dietary exposure analyses. The complete spreadsheet is available upon request.

III. Drinking Water Data

Residues of 1,2,4-triazole in drinking water were provided to HED by the Environmental Fate and Effects Division (I. Maher, D320682, 02/28/2006). Due to the inter-conversion between 1,2,4-triazole, triazole alanine, and triazole acetic acid that may occur in the environment, the

residue estimates used in these assessments are a summation of all three residues and, therefore, represent an overestimate of actual concentrations of the common triazole metabolites in drinking water. The Tier II PRZM/EXAMS (surface water) and SCIGROW (groundwater) residue estimates are summarized in Table 2. HED notes that there were no detects of 1,2,4-triazole in any of the 271 water samples analyzed by PDP, with a limit of quantification of 730 parts-per-trillion (0.73 ppb). The surface water estimates are significantly greater than those for groundwater, and were used in the assessments for free triazole as well as the conjugated metabolites.

Table 2. Summary of Estimated Drinking Water Concentrations of 1,2,4-Triazole.		
Exposure Duration	Surface Water Concentration, ppm	Groundwater Concentration, ppm
Acute	0.041	0.001
Chronic	0.011	0.001

IV. DEEM-FCID™ Program and Consumption Information

Triazole metabolite acute and chronic dietary exposure assessments were conducted using the DEEM-FCID, Version 3.16, which incorporates 2003-2008 consumption data from USDA's NHANES/WWEIA. The data are based on the reported consumption of more than 20,000 individuals over two non-consecutive survey days. Foods "as consumed" (e.g., apple pie) are linked to EPA-defined food commodities (e.g., apples, peeled fruit - cooked; fresh or N/S; baked; or wheat flour - cooked; fresh or N/S, baked) using publicly available recipe translation files developed jointly by USDA/ARS and EPA. For chronic exposure assessment, consumption data are averaged for the entire U.S. population and within population subgroups. However, for acute exposure assessment, consumption data are retained as individual consumption events. Based on analysis of the 2003-2008 WWEIA consumption data, which took into account dietary patterns and survey respondents, HED concluded that it is most appropriate to report risk for the following population subgroups: the general U.S. population, all infants (<1 year old), children 1-2, children 3-5, children 6-12, youth 13-19, adults 20-49, females 13-49, and adults 50-99 years old.

For a chronic dietary exposure assessment, an estimate of the residue level in each food or food-form (e.g., orange or orange juice) on the food commodity residue list is multiplied by the average daily consumption estimate for that food/food form to produce a residue intake estimate. The resulting residue intake estimate for each food/food form is summed with the residue intake estimates for all other food/food forms on the commodity residue list to arrive at the total average estimated exposure. Exposure is expressed in mg/kg body weight/day and as a percent of the cPAD. This procedure is performed for each population subgroup.

For an acute exposure assessment, individual one-day food consumption data are used on an individual-by-individual basis. The reported consumption amounts of each food item can be multiplied by a residue point estimate and summed to obtain a total daily pesticide exposure for a deterministic exposure assessment, or "matched" in multiple random pairings with residue values and then summed in a probabilistic assessment. The resulting distribution of exposures is expressed as a percentage of the aPAD on both a user (i.e., only those who reported eating relevant commodities/food forms) and a per-capita (i.e., those who reported eating the relevant commodities as well as those who did not) basis. In accordance with HED policy, per capita

exposure and risk are reported for analyses performed at all levels of refinement. However, for deterministic assessments, any significant differences in user vs. per capita exposure and risk are specifically identified and noted in the risk assessment.

V. Toxicological Information

1,2,4-Triazole and the conjugated metabolites are common metabolites of many triazole-derivative fungicides. As metabolites, there are no data requirements, *per se*, for these compounds. Nevertheless, a significant amount of toxicological data is available and has been reviewed by HED. The following summary tables (Tables 3 and 4) show the doses selected for assessing dietary exposure and their associated endpoints. Data are insufficient at this time to assign a cancer classification to 1,2,4-triazole. Available data indicate that cancers associated with 1,2,4-triazole and the conjugated metabolites are likely to be a threshold effect and that a Q₁* approach is not appropriate. An RfD-approach for assessing cancer has been recommended. As such, the chronic exposure assessments are considered to be protective of any potential cancer-related effects.

Table 3. Summary of Toxicological Doses and Endpoints for Dietary Exposure Risk Assessments of 1,2,4-Triazole				
Exposure/ Scenario	Point of Departure	Uncertainty/ FQPA Safety Factors	RfD, PAD, Level of Concern	Study and Toxicological Effects
Acute Dietary (females 13-49)	NOAEL = 30 mg/kg	UFA = 10 UF _H = 10 UF _{DB} = 10 FQPA SF = 1	aPAD = <u>acute RfD</u> FQPA SF = 0.03 mg/kg/day	Developmental Toxicity study in rabbits
	Acute RfD = 0.03 mg/kg			LOAEL=45 mg/kg based on urinary tract malformations in fetuses
Acute Dietary (general population)	NOAEL = 30 mg/kg	UFA = 10 UF _H = 10 UF _{DB} = 10 FQPA SF = 1	aPAD = <u>acute RfD</u> FQPA SF = 0.03 mg/kg/day	Developmental Toxicity study in rabbits
	Acute RfD = 0.03 mg/kg			LOAEL=45 mg/kg based on clinical signs and mortality in does starting on Gestation Day 6 or 7
Chronic Dietary (all populations)	LOAEL = 15 mg/kg/day	UFA = 10 UF _H = 10 UF _{DB} = 10 UF _L = 3 FQPA SF = 1	cPAD = <u>chronic RfD</u> FQPA SF =0.005 mg/kg/day	Reproductive Toxicity study in rats LOAEL = 15 based on decreased body weight in adult males and on decreased body weight and brain weight in offspring
	Chronic RfD = 0.005 mg/kg/day			
Cancer	Insufficient data for a cancer classification. Based on the available information, HED believes that an RfD approach is appropriate and that the cPAD is sufficient to assess cancer risk.			

Point of Departure (POD) = A data point or an estimated point that is derived from observed dose-response data and used to mark the beginning of extrapolation to determine risk associated with lower environmentally relevant human exposures. NOAEL = no observed adverse effect level. LOAEL = lowest observed adverse effect level. UF = uncertainty factor. UFA = extrapolation from animal to human (intraspecies). UF_H = potential variation in sensitivity among members of the human population (interspecies). UF_L = use of a LOAEL to extrapolate a NOAEL. UF_{DB} = to account for the absence of key data (i.e., lack of a critical study). FQPA SF = FQPA Safety Factor. PAD = population adjusted dose (a = acute, c = chronic). RfD = reference dose.

Table 4. Summary of Toxicological Doses and Endpoints for Dietary Exposure Risk Assessments of the Conjugated Triazole Metabolites (TA, TAA).				
Exposure/ Scenario	Point of Departure	Uncertainty/FQPA Safety Factors	RfD, PAD, Level of Concern	Study and Toxicological Effects
Acute Dietary (females 13-49)	NOAEL = 100 mg/kg	UFA = 10 UF _H = 10 UF _{DB} = 10	aPAD = <u>acute RfD</u> FQPA SF = 0.1 mg/kg/day	Developmental Toxicity study in rabbits
	Acute RfD = 0.1 mg/kg	FQPA SF = 1		LOAEL=45 mg/kg based on urinary tract malformations in fetuses

Acute Dietary (general population)	None	None	None	No appropriate dose and endpoint could be identified for this population group.
Chronic Dietary (all populations)	LOAEL = 90 mg/kg/day Chronic RfD = 0.09 mg/kg/day	UF _A = 10 UF _H = 10 UF _{DB} = 10 FQPA SF = 1	cPAD = $\frac{\text{chronic RfD}}{\text{FQPA SF}}$ = 0.09 mg/kg/day	Reproductive Toxicity study in rats LOAEL = 15 based on decreased body weight in adult males and on decreased body weight and brain weight in offspring
Cancer	Insufficient data for a cancer classification. Based on the available information, HED believes that an RfD approach is appropriate and that the cPAD is sufficient to assess cancer risk.			

Point of Departure (POD) = A data point or an estimated point that is derived from observed dose-response data and used to mark the beginning of extrapolation to determine risk associated with lower environmentally relevant human exposures. NOAEL = no observed adverse effect level. LOAEL = lowest observed adverse effect level. UF = uncertainty factor. UF_A = extrapolation from animal to human (intraspecies). UF_H = potential variation in sensitivity among members of the human population (interspecies). UF_{DB} = to account for the absence of key data (i.e., lack of a critical study). FQPA SF = FQPA Safety Factor. PAD = population adjusted dose (a = acute, c = chronic). RfD = reference dose.

VI. Results/Discussion

As stated above, for acute and chronic assessments, HED is concerned when dietary risk exceeds 100% of the PAD. The DEEM-FCID™ analyses estimate the dietary exposure of the U.S. population and various population subgroups. The results reported in Table 5 are for the general U.S. Population, all infants (<1 year old), children 1-2, children 3-5, children 6-12, youth 13-19, females 13-49, adults 20-49, and adults 50-99 years. A quantitative cancer assessment is not required for the common triazole metabolites.

Acute and chronic dietary exposure estimates are below HED's level of concern for all population subgroups, including those of infants and children, for both 1,2,4-triazole as well as the conjugated triazole metabolites.

Table 5. Summary of Dietary (Food and Drinking Water) Exposure and Risk for the Common Triazole Metabolites Adding the New Uses for Difenconazole and Mefentrifluconazole.

Population Subgroup	Acute Dietary (95 th Percentile)		Chronic Dietary		Cancer	
	Dietary Exposure (mg/kg/day)	% aPAD*	Dietary Exposure (mg/kg/day)	% cPAD*	Dietary Exposure (mg/kg/day)	Risk

Females 13-49 years old	0.078714	79	0.012308	14		

* The values for the highest exposed population for each type of risk assessment are bolded.

VII. Characterization of Inputs/Outputs

Although these dietary exposure assessments are principally based on calculated residues, the data, selection criteria, and assumptions that serve as the source of those residues are conservative in nature. Most residue estimates used in the assessment are derived from tolerance-level residues of the parent triazole and it was assumed that 100% of foods with a triazole-derivative-fungicide tolerance have residues of the triazole metabolites (100% crop treated). For the new uses of difenoconazole and mefentrifluconazole; tolerance level residues were used. Overall, this assessment is considered to be conservative and likely overestimates actual direct and indirect dietary exposure to the triazole metabolites. Regulatory recommendations at the 95th percentile are appropriate.

VIII. Conclusions

Based on conservative estimates of direct and indirect dietary exposure, acute and chronic risk estimates for the general U.S. population and all representative population subgroups, including those of infants and children, are below HED's level of concern for both 1,2,4-triazole and the conjugated triazole metabolites. There were increases in the risk estimates from the addition of the new uses for difenoconazole and mefentrifluconazole. There are no dietary exposure considerations for the common triazole metabolites that would preclude granting the requested uses of the triazole fungicides difenoconazole and mefentrifluconazole.

IX. List of Attachments

- Attachment 1. Inputs for the acute dietary exposure and risk analysis of 1,2,4-triazole.
- Attachment 2. Inputs for the chronic dietary exposure and risk analysis of 1,2,4-triazole.
- Attachment 3. Inputs for the acute dietary exposure and risk analysis of the conjugated triazole metabolites.
- Attachment 4. Inputs for the chronic dietary exposure and risk analysis of the conjugated triazole metabolites.
- Attachment 5. Summary of the acute dietary exposure and risk estimates for 1,2,4-triazole.
- Attachment 6. Summary of the chronic dietary exposure and risk estimates for 1,2,4-triazole.
- Attachment 7. Summary of the acute dietary exposure and risk estimates for the conjugated triazole metabolites.

Attachment 8. Summary of the chronic dietary exposure and risk estimates for the conjugated triazole metabolites.

Attachment 1. Inputs for the acute dietary exposure and risk analysis of 1,2,4-triazole.
